[1] 100% tested - DC parameters tested on-wafer, insertion gain tested using a 50 ohm contact board (no matching circuitry) during final production test.

[2] Sample tested - Samples pulled from each wafer/package lot. Sample test specifications are based on statistical data from 500 devices across 5 wafers, 3 wafer lots. The test fixture is an engineering application circuit board (parts are pressed down on the circuit board). The application circuit represents a trade-off between the optimal noise match and input return loss.

### Junction Temperature Calculation

MTTF is inversely proportional to the device junction temperature. For junction temperature and MTTF considerations the device operating conditions should also satisfy the following expression:

$$P_{DC} < (T_J - T_L) / R_{TH}$$

where:

$$P_{DC} = I_{DS} * V_{DS} \text{ (W)}$$

$$T_J = \text{Junction Temperature (C)}$$

$$T_L = \text{Lead Temperature (pin 2) (C)}$$

$$R_{TH} = \text{Thermal Resistance (C/W)}$$

### Biasing Details

The SPF-3043 is a depletion mode FET and requires a negative gate voltage to achieve pinchoff. As such, power supply sequencing circuitry is strongly recommended to prevent damaging bias transients during turn-on. Active bias circuitry is also recommended to maintain a constant drain current from part-to-part.
